

BURMESE CATHOLIC COMMUNITY OF WESTERN AUSTRALIA

System Design & Automation Guide

How the BCC website connects to automatic helpers (n8n) — explained without technical jargon.

For committee and staff who want to understand the moving parts, without needing IT training.

Website: <https://bccwac.com>

August 2026

Plain idea

The website is the front door. The Admin Panel is the staff office. Automation is a reliable assistant that sends alerts and emails at the right moment — but only after people take clear actions (subscribe, enquire, publish).

1. The three parts that work together

Part	Everyday meaning	What it does
Public website	The community's online home	Shows pages, accepts Get Involved forms, accepts subscriptions
Admin Panel	Private staff office	Manage posts, events, subscribers, enquiries, reports, pages
Automation (n8n)	Always-on helper on BCC's existing VPS	Sends Telegram alerts, staff emails, welcome emails, and event emails

Automation does **not** invent content. It only reacts when the website sends an approved signal — for example “a new subscriber joined” or “an upcoming event was published”.

2. Why automation helps BCC

- Staff are notified quickly when someone needs follow-up.
- New subscribers receive a warm welcome with useful links.
- Event announcements can reach the mailing list without copying emails by hand.
- Drafts stay private — nothing unfinished is auto-sent to the community.

3. The four instant workflows (already live)

Think of each workflow as a trained assistant with one job.

A) Inquiry Alert — Get Involved & follow-up queue

	Trigger Someone submits Get Involved, or staff change/close an enquiry status.
	Website action Saves the enquiry and signals the Inquiry Alert helper.
	Automation action Sends Telegram message to BCC WA Charity Community and email to bccwacharity@gmail.com.
	Staff result Someone opens Admin → Enquiries, follows up, and closes the case when finished.

B) Subscribe Alert — mailing list join / rejoin

	Trigger A visitor subscribes (or reactivates) on Home or Events with consent.
	Website action Saves the subscriber and signals the Subscribe Alert helper.
	Automation action 1) Staff Telegram + Gmail alert. 2) Welcome email to the visitor with website, Events, About, Facebook group, and info@bccwac.com.
	Staff result Person appears in Admin → Subscribers and will receive later event emails while active.

C) Event Mail — announce an upcoming event

	Trigger Staff publish an upcoming event for the first time.
	Website action Sends event details plus the active subscriber list to the Event Mail helper.
	Automation action Emails subscribers from BCC Gmail and posts a short staff Telegram summary.
	Safety rules Drafts never mail. Re-saving an already published event does not re-send. Past-dated events do not mail.

D) Publish Distribution — after a post is published

	Trigger Administrator / Owner publishes a post.
	Website action Signals Publish Distribution with the published post details.
	Automation action Ready for approved outward distribution steps configured in n8n.
	Safety rule Draft and review content never enter this path.

4. Picture of the whole flow

Use this map when explaining the system to new helpers:

Start	Middle	End
Visitor uses website form / staff publish	Website stores record + sends signal	Automation emails / Telegram alerts people
Get Involved	Enquiry saved in follow-up queue	Staff alert → human reply → close
Subscribe	Subscriber saved	Welcome email + staff alert
Publish upcoming event	Event saved as published	Event email to active subscribers
Publish post	Post becomes public	Distribution helper may run

5. What is automatic vs what needs a person

Automatic (helper)	Needs a person (staff)
Send staff Telegram/email alerts	Read the enquiry and reply with pastoral care
Send welcome email to new subscribers	Decide what community posts/events to publish
Send event announcement emails	Create accurate event details and dates
Record who closed an enquiry	Choose follow-up dates and mark cases closed
Keep drafts from going public	Review content before publish

Key message for non-IT users

Automation is a messenger and reminder system. It does not replace pastoral judgment, prayerful care, or committee decisions.

6. Where things live (simple hosting picture)

- **Website domain:** bccwac.com (Hostinger).
- **Staff email examples:** info@bccwac.com, admin@bccwac.com, secretary@bccwac.com; charity alerts also use bccwacharity@gmail.com.
- **Automation home:** existing Hostinger VPS already running n8n — no need for a second automation server just for BCC.
- **Admin Panel:** staff accounts are separate from Hostinger hPanel. hPanel is infrastructure (hosting/domain/email). Admin is community content and follow-up.

7. Safety and trust rules built into the design

- Draft → review → authorised publish → then automation.
- Editors cannot publish or open subscriber / enquiry lists.
- Consent is required before someone joins the mailing list.
- Closed enquiries keep a record of who handled them.
- No government/endorsement claims without written evidence.

8. If something seems missing

Symptom	Likely place to check	Who usually helps
No staff alert for Get Involved	Telegram group / staff Gmail / Admin Enquiries	Administrator / Owner
Subscriber got no welcome email	Spam folder; confirm subscribe succeeded on website	Administrator / Owner
Event email did not send	Was the event upcoming and newly published?	Administrator / Owner
Editor cannot publish	Normal role limit — ask Administrator	Owner / Administrator
Need printed lists	Admin → Reports export	Owner / Administrator

9. One-page summary for meetings

BCC's website collects community requests and subscriptions. Staff manage them in Admin. Seven automation workflows quietly send the right alerts and emails at the right time — four react instantly to visitor actions, and three run on a schedule to keep the team on track. People remain responsible for content quality, pastoral follow-up, and publishing decisions.

Pair this with Guide 1 (Website User Flow Guide) when training new committee members.
